Relevant Experience

Lockchain *A digital assets intelligence platform*

Senior Software Engineer & Project Manager *November 2025 – Present*

- Lead end-to-end execution of cross-functional initiatives across analytics, backend, and admin UI, driving scope, architecture, delivery, and launch.
- Re-architected event detection with agentic workflows, improving response latency and materially reducing analyst toil.
- Incubated intern-led POC-to-production programs (chatbot, early opportunity scanner), converting exploratory work into shipped platform capabilities.
- Served as technical lead for time-sensitive client and pre-sales builds tied to revenue outcomes, including a prediction-markets intelligence platform taken from empty repo to deployed AWS production in under 2 months, with agentic cross-venue contract matching, custom RAG pipelines, admin and client portals, and an MCP-backed chatbot, which opened a new asset class and expanded the platform's addressable market.
- Mentor junior engineers and interns through design reviews and pairing while concurrently managing 1–3 interns across active projects.

Software Engineer *December 2024 – November 2025*

- Built and integrated RAG collection infrastructure across platform services, unifying dozens of data sources into explainable AI context used in production decision workflows.
- Designed and operationalized the engineering hiring funnel, hiring 9 interns and 3 junior engineers with 0 mis-hires.
- Drove intern project delivery for notification systems, PDF processing pipelines, and admin UI enhancements that expanded internal platform capabilities.
- Took ownership of engineering execution management in Sep 2025: migrated planning from Jira to Linear, redesigned operating cadence, and led standups to improve predictability and throughput.
- Promoted to Senior Software Engineer in Nov 2025 for expanded technical scope and sustained delivery leadership.

Software Engineering Intern *Spring 2024, Fall 2024*

- Built foundational wallet monitoring and Twitter/X risk-event detection capabilities used in Lockchain's core intelligence workflows.
- Authored design docs that accelerated implementation and improved cross-team technical alignment.
- Recruited and helped onboard the next intern cohort, then continued mentoring as a full-time engineer.

MongoDB

Software Engineering Intern *Summer 2025*

- Extended the MongoDB Agent (Go) with a new data collector querying active deployments, built a Java control plane endpoint to process, tokenize, and stream data to AWS Kinesis, and ensured stability across the full pipeline with unit, integration, and E2E tests.

Kudelski Security *A global managed security services provider*

Full Stack & DevOps Engineering Co-Op *Summer 2022, Spring 2023 – Spring 2024*

- Built phishing email validation pipeline (Azure Logic Apps, Functions, OpenAI) deployed to 4,000 users, and developed sales tools with Snowflake/Streamlit hosted via Docker/Kubernetes CI-CD.
- Built SIEM rule monitoring app (Spring, Vue, ArangoDB), repository vulnerability dashboard (Snowflake, Power BI), and cross-cluster Elasticsearch instance orchestrated with Terraform.
- Contributed resumable chunked upload to Apache Guacamole (50M+ Docker pulls, Java/C) — GUACAMOLE-1320 merged 7/30/2022.

NewFields Environmental Services *A mid-sized environmental, engineering, and construction consulting firm* *Summer 2021*

Data Analyst & Software Engineering Intern

- Environmental justice analysis in R that secured a Southern Company portfolio contract; built ArcGIS/ArcPy tooling and custom OCR table-scanner (pandas, bs4) for geospatial data pipelines.

Personal Projects

Narwarp *Forking Warp Terminal to embed an agentic harness with self-hosted LLMs*

Eden *Hacking a MIDI controller into a Jambox*

Lightlaland *DMX Lighting console built for my living room to sync lights with vinyl DJs while they perform.*

JSonic *A clipboard-based pop-up JSON analyzer and differ you can run in the toolbar*

Eden *Hacking a MIDI controller into a Jambox*

Fish *An educational Game Boy Advance video game about saving our oceans, written in C, with original artwork. (Playable on my website!)*

Education & Certifications

Georgia Institute of Technology | Atlanta, GA *Fall 2021 – December 2024*

- Bachelor of Science in Computer Science, GPA: 3.92
- Junior Design: Automated Algorithm Design VIP (Jan 2022 – May 2023): Founded and led stocks sub-team applying a multi-objective genetic ML framework to portfolio optimization, across 3 semesters of research.
- PLUS Leader (i.e. group tutor) for Data Structures and Algorithms & Object Oriented Programming

Lean and Six Sigma Green Belt | Administered by IISE *September 2023*

Relevant Skills

Programming: Python, JavaScript, Java, C, R, Go, Rust
Tools: Adobe Creative Cloud Suite, Angular, AngularJS, Apache Tomcat, ArcGIS, Azure (Functions, Logic Apps, Blob Storage), Canva, Docker, ELK Stack, Figma, Flutter, Git, GitHub/GitLab Actions, Kubernetes, MS Teams, MongoDB, MySQL, Postman, Power BI, Processing, React, Slack, Snowflake, Streamlit, Swagger, Terraform, Tines, VirtualBox, Vue, Wireshark
Less Relevant Skills: Music (Piano, ukulele, vinyl), Touching Grass (hiking, volleyball), Media (photography, graphic art, branding)
