# Lila Nicpon (She/Her)

New York City | U.S. Citizen | (678) 876-6531 | lila@nicpon.com | lila.nicpon.com | github.com/lilaland

## Relevant Experience

**Lockchain** *A digital assets intelligence platform*

*Senior Software Engineer & Project Manager* — *November 2025 – Present*

- Run planning and delivery for a 10+ person engineering team across the data pipeline, backend, internal tools and customer portal, driving scope, architecture, and launch.
- Re-architected event detection as a two-stage LLM agent pipeline (extraction → QC), with confidence-gated auto-publish and AI duplicate detection, replacing two legacy systems. Added whole-flow shadow A/B testing so prompt and model changes are proven on live traffic before promotion.
- Founding engineer on a prediction-market intelligence product that matches 3.1M contracts across major prediction markets and shows venues their settlement risks and listing gaps. Owned the whole build, from the matching engine, data pipelines, alerting and client portal to the AWS and Postgres infrastructure (pgvector + per-client row-level security, a key scan cut from 88 s to under 7 s), monitoring, performance and cost tuning, and the brand. Demoed at Predict 2026 in NYC, drawing interest from a variety of prediction markets venues.
- Created and ran an intern program that took POCs to production (platform chatbot, early listing opportunity scanner, agentic source evaluation, transaction monitoring scoring), converting exploratory work into shipped platform capabilities.
- Mentor junior engineers and interns through design reviews and pairing while concurrently managing 1–3 interns across active projects.

*Software Engineer* — *December 2024 – November 2025*

- Built the company's first RAG system on Weaviate with hybrid keyword and vector search, then merged document and OFAC sanctions search into one service with per-client private collections.
- Designed and built the infrastructure our LLM agents run on: an event-driven and scheduled job system that gives each agent type its own tools, memory, model, prompt version, tool-call budget and timeout, with reinforcement learning pipelines, tracing, retries, and shadow runs that never touch production. It runs 20+ job types, from event detection to source auditing, at 6,700+ jobs a month with fewer than 1 in 2,000 failing. Low-confidence output goes to analyst review queues instead of being published.
- Built a real-time price and stablecoin depeg alerting product from scratch, polling every 15 seconds and alerting clients by Slack and email.
- Set up engineering hiring from scratch (process, take-home, interview guides) and hired 9 interns and 3 junior engineers, with no mis-hires.
- Drove intern project delivery for notification systems, PDF processing pipelines, and analyst data portal enhancements that expanded internal platform capabilities.
- Took ownership of engineering execution management in Sep 2025: migrated planning from Jira to Linear, redesigned operating cadence, and led standups to improve predictability and throughput.
- Promoted to Senior Software Engineer in Nov 2025 for expanded technical scope and sustained delivery leadership.

*Software Engineering Intern* — *Spring 2024, Fall 2024*

- Built the wallet monitoring backend: webhook ingestion from two blockchain data providers, counterparty lookups across BTC, BCH, DOGE and SOL, and a transactions API for customers. Replaced a full-table scan in alert routing with an index lookup.
- Built customer Slack alerts, from the install flow and encrypted token storage to per-org settings, and an API that builds risk-event timelines from tweets and URLs.
- Ran the next intern hiring round and onboarded the cohort, then kept mentoring them after going full time.

**MongoDB**

*Software Engineering Intern* — *Summer 2024*

- Extended the MongoDB Agent (Go) with a new data collector querying active deployments, built a Java control plane endpoint to process, tokenize, and stream data to AWS Kinesis, and ensured stability across the full pipeline with unit, integration, and E2E tests.

**Kudelski Security** *A global managed security services provider*

*Full Stack & DevOps Engineering Co-Op* — *Summer 2022, Spring 2023 – Spring 2024*

- Built phishing email validation pipeline (Azure Logic Apps, Functions, OpenAI) deployed to 4,000 users, and developed sales tools with Snowflake/Streamlit hosted via Docker/Kubernetes CI-CD.
- Built SIEM rule monitoring app (Spring, Vue, ArangoDB), repository vulnerability dashboard (Snowflake, Power BI), and cross-cluster Elasticsearch instance orchestrated with Terraform.

- Contributed resumable chunked upload to Apache Guacamole (50M+ Docker pulls, Java/C) — GUACAMOLE-1320 merged 7/30/2022.

**NewFields Environmental Services** *A mid-sized environmental, engineering, and construction consulting firm* *Summer 2021*
*Data Analyst & Software Engineering Intern*
- Environmental justice analysis in R that secured a Southern Company portfolio contract; built ArcGIS/ArcPy tooling and custom OCR table-scanner (pandas, bs4) for geospatial data pipelines.

## Personal Projects

**Narwarp** *Forking Warp Terminal to embed an agentic harness with self-hosted LLMs*

**Eden** *Hacking a MIDI controller into a Jambox*

**Lightlaland** *DMX Lighting console built for my living room to sync lights with vinyl DJs while they perform.*

**JSonic** *A clipboard-based pop-up JSON analyzer and differ you can run in the toolbar*

**Fish** *An educational Game Boy Advance video game about saving our oceans, written in C, with original artwork. (Playable on my website!)*

## Education & Certifications

**Georgia Institute of Technology | Atlanta, GA** *Fall 2021 – December 2024*
- Bachelor of Science in Computer Science, GPA: 3.92
- Junior Design: Automated Algorithm Design VIP (Jan 2022 – May 2023): Founded and led stocks sub-team applying a multi-objective genetic ML framework to portfolio optimization, across 3 semesters of research.
- PLUS Leader (i.e. group tutor) for Data Structures and Algorithms & Object Oriented Programming

**Lean and Six Sigma Green Belt |** Administered by IISE *September 2023*

## Relevant Skills

**Programming:** Python, Typescript, Javascript, Java, C, R, Go, Rust
**Tools:** Adobe Suite, Apache Tomcat, ArcGIS, Azure (Functions, Logic Apps, Blob Storage), AWS (Lambda, DynamoDB, SQS, Bedrock), Docker, Figma, GitHub/GitLab, Kubernetes, MongoDB, MySQL, Postman, Power BI, Processing, React, Slack, Snowflake, Terraform, Wireshark, Pydantic AI, MCP
**Less Relevant Skills:** Music (Piano, ukulele, vinyl djing), Touching Grass (hiking, baseball, volleyball), Media (photography, graphic art, branding)
